Table of Contents

Data

Data are received via RS-232 serial connections. In SCS a time tag is added at the beginning of each line of data in the form,
mm/dd/yyyy,hh:mm:ss.sss,[data stream from instrument] where:

Format	Value used
mm	2 digit month of the year
dd	2 digit day of the month
yyyy	4 digit year
hh	2 digit hour of the day
mm	2 digit minute
ss.sss	seconds

An example string from the Seabeam Centerbeam file is:
04/13/2007,06:49:20.920,$SBCTR,2007,4,13,06:49:09.437,57.158792,-165.664322 ,69.15,60*00
All times are reported in UTC. Each file type has it's own NMEA string name ($SBCTR as an example). The delimiters that separate fields in the raw data files are commas. Care should be taken when reprocessing the data that the field's separations are clearly understood.

LDEO Averaged One Minute Data File

The data are summarized into an averaged one (1) minute data file by the LDEO technician. This file takes the average value centered around the minute, (30 seconds either side of the whole minute). The data are the raw values as they are logged. There has been no quality control done on these files. Those wishing more accurate and quality controlled values should process the data in the directories described below in the document.

SAMOS (Shipboard Automated Meteorological and Oceanographic Systems)

Data formatted to be sent to the U.S. Research Vessel Surface Meteorology Data Assembly Center (DAC). These data are in files that have only a single value. Every variable sent into SAMOS is in a separate file. The name of the file should tell the user what the variable is.

There are two types of formats used. The bulk of the data has the date, time, a NMEA header for derived data, the mean data for the minute, the last value used in the minute, the total of all the values for the minute and the number of values used to get the mean. The other is for data that is in degrees. The data for degrees has the date, time, a NMEA header for derived data, the mean data for the minute found using the arc tangent of the sine and cosine of the data, the last data value for the minute, the mean of the sums of the sin of the data, the mean of the sum of the cosines of the data and the number of values used to get the mean.

For caluculation of the True wind direction and speed value for SAMOS the method is a less accurate one. The directions are caluculated as desribed above with the means of the sine and cosine of the angles applied to the arctangent for an average heading. The True winds are only a mean of the values entered. In the future (2009???) the direction and speed averages will be calulated using the vectors these data represent.

ISUS Nitrate Sensor 3V

ISUS Nitrate Sensor 3V, MBARI/Satlatic ISIS V3, instrument in the Bio/Chem Lab. Data is logged every 5 minutes for a few seconds. The data only gets the SCS time stamp at the start of data being sent in that time window. These files are very large. A more complete description of this format is below in a section from the Satlantic Operation Manual's format secton. The example of the data below only shows the first 6 columns of data.

The following sections are in the Raw data directory.

75 KHz ADCP data

./adcp75

The shipboard ADCP system measures currents in the depth range from about 30 to 300 m -- in good weather. In bad weather or in ice, the range is less, and sometimes no valid measurements are made. ADCP data collection occurs on the Healy for the benefit of the scientists on individual cruises and for the long-term goal of building a climatology of current structure in the Ocean.

The ADCP 75 data set collected during this cruise are placed in the directory ./Raw/adcp75. The files are named by the cruise, HLY0901, a three place number of the sequence in the files, then an extra "_000000", and then an extent for the kind of data in the file. An example of the files for one set is:

150 Khz ADCP data

./adcp150

The shipboard ADCP system measures currents in the depth range from about 30 to 300 m -- in good weather. In bad weather or in ice, the range is less, and sometimes no valid measurements are made. ADCP data collection occurs on the Healy for the benefit of the scientists on individual cruises and for the long-term goal of building a climatology of current structure in the Ocean.

The ADCP150 data set collected during this cruise are placed in the directory ./Raw/adcp150. The files are named by the cruise, HLY0901, a three place number of the sequence in the files, then an extra "_000000", and then an extent for the kind of data in the file. An example of the files for one set is:

KNUDSEN 320B/R

The Knudsen 320B/R depth sounder can record depth in both 3.5 and 12 kHz mode. The Healy records the 3 - 6kHz data (Sub Bottom Profile) underway. This data is saved in all of the formats that the Knudsen can record data in. These files are in both ASCII and BINARY format (see the table below). This data is also saved as depth in SCS_Data/Knudsen.

./knudsenraw

FILENAME	FORMAT	DEFINITION
2007_102_0005_004.keb	Binary	Knudsen Playback File
2007_102_0005_008.kea	Ascii	Log of depth, settings and environmental data
2007_102_0005_HF_001.sgy	Binary	SEG-Y extended Seismic format

Seabeam

The raw Seabeam 2112 files are in this directory. The naming convention uses the year, month, Julian day, and the start hour and minute in it. For year 2007 on day 110 starting at 11:12 the name would be sb20071101112.mb41. mb41 is the MB-System multibeam format number for the Seabeam 2112. These files can best be accessed and used by using the MB-System software.

./Seabeam

sb20071091600.mb41

CTD

Data for the each CTD cast are contained here. These files are in SeaBird software's format. Each cast is in a separately numbered subdirectory. The Names of the files vary by cruise but file extent examples below will be consitant.

./ctd

FILENAME	FORMAT	DEFINITION
021.BL	ASCII	Bottle firing information
021.CON	ASCII	The configuration file for the cast
021.HDR	ASCII	Header information for the cast
021.btl	ASCII	Averaged Bottle firing information
021.cnv	ASCII	The data
021.dat	Binary	The data
021.jpg	Binary	Plotted JPEG image of the cast
021.ros	ASCII	Data from when bottles fire
021avg.cnv	ASCII	Meaned 1 meter down cast of the data

Environmental_sensors

This directory contains the log files for the temperature probes recording the cold room and freezer tempeatures. The files are all in ASCII. A list of the current files is below. These can be plotted with any simple plotting program or Spread sheet program. There is a header that tells what the columns are.

Biochem_RH.txt
Biochem_Temp.txt

Expendable Bathythermograph (XBT)

The file names use the sequence number of the XBT or Expendable Sound Velocimeter (XSV) in the series used for the cruise.

FILENAME	EXTENSION	DEFINITION	PROGRAM REQUIRED to read the file
drop001	asc	ASCII with detailed header	Any text/spreadsheet

LDS_Data

The Lamont Data Logging System (LDS) outputs it's file to LDS_Data. Below are directories in which data is written to.

Navigation

Navigation data are logged in the format they come from the device with a data source stamp and a time stamp added to them in several directories in LDS_Data. These data strings are in NMEA (National Marine Electronics Association) format. You will need a copy of NMEA 183, Standard for Interfacing Marine Electronics Devices, Version 2.3, March 1, 1998, to help you understand the data formats used. These data are also in the SCS_Data directories that are described above in formats that are explained. The web-site http:/www.gpsinformation.org/dale/nmea.htm might help you understand these formats. Example files will be shown below but no formats will be given.

All SIO TSG and MET Data

All of the data from the SIO TSG and Meteorological Sensors are sent in one serial line. All of these data have different NMEA strings and formats. This is a single file for all these data. This data is also in the SCS data sections above in the Meteorological section. The format for this file can be seen here.

HLY0901 - Sensor Calculations

The coefficients for temperature, conductivity, fluorometer and turbidity sensors can be found in the calibrations sheets below in the Appendix.

Calculating Temperature – ITS-90

T = decimal equivalent of bytes 1-4

Temperature Frequency: f = T/19 +2100

Temperature = $1/\{g + h[ln(f_0/f)] + i[ln^2(f_0/f)] + j[ln^3(f_0/f)]\} - 273.15$ (°C)

Calculating Conductivity – ITS-90

C = decimal equivalent of bytes 5-8

Conductivity Frequency f = sqrt(C*2100+6250000)

Conductivity = $(g + hf^2 + if^3 + jf^4)/[10(1 + \delta t + \varepsilon p)]$ (siemens/meter)

t = temperature (°C); p = pressure (decibars); δ = Ctcor; ε = CPcor

Calculating Fluorometry Voltage

f = decimal equivalent of bytes 15-17

Fluorometry Voltage = f/819

Calculating Transmittance

V_{dark} = 0.058 V

V_{ref} = 4.765 V

t = decimal equivalent of bytes 18 – 20

Transmissometer Voltage (V_{signal}) = t/819

% Transmittance = $(V_{signal} - V_{dark}) / (V_{ref} - V_{dark})$

Calculating PAR for surface PAR

raw data = mV

calibration scale = 6.08 V/(μEinstiens/cm ^{2}sec)

offset (V_{dark}) = 0.3 mV

(*raw* mV - V_{dark})/scale x 10^4 cm^2/m^2 x 10^{-3} V/mV= μEinstiens/m^2sec

or

(*data* mV – 0.3 mV) x 1.65 (μEinstiens/m^2sec)/mV = μEinstiens/m^2sec

Calculating Pyrgeometer Values

V = Eppley PIR Thermopile voltage

S = Sensitivity (Calibration factor from Eppley Cal sheet)

S = 3.32

J = Stefan-Boltzmann Constant

J = 5.6697e-8

B = [absorption constant (for Eppley Black paint formula) 0.985 / dome glass IR transmission 0.5]

B= 3.5 for Stock Eppley PIR

Tb = Eppley Body Temperature in degrees Kelvin

Td = Eppley Dome Temperature in degrees Kelvin

Tb and Td calculated as follows:

```
T = 1/ (a + ln(Vo/Irt)*(b + c*(ln(Vo/Irt)**2)));
```

```
>Irt = (Vref-Vin)/R1
On Healy R1 = 82500                    Vref = 5.0>
a= 0.0010295       b= 0.000239         c = 1.568e-7
W/M2 = V/S + (J * Tb^4) + (B*J*(Tb^4 - Td^4))
```

MBARI-ISUS V3 Data File FORMAT
From Satlantic Document SAT-DN-425 pages D-5 and D-6

Field Name	Format	Description
INSTRUMENT	AS 10	The frame header or synchronization string starts with "SAT" for a Satlantic instrument, followed by three characters identifying the frame type. The last four characters are the instrument serial number.
DATE	AS 7 BS 4	The date field denotes the date at the time of the sample, using the year and Julian day. The format is YYYYDDD.
TIME	AF 9 BD 8	The time field gives the GMT/UTC time of the sample in decimal hours of the day.
NTR_CONC	AF 4..7 BF 4	The Nitrate concentration as calculated by the ISUS is reported in ?Mol/L; in ASCII frames to 2 decimal places.
AUX1	AF 4..7 BF 4	First auxiliary fitting result of the ISUS is reported.
AUX2	AF 4..7 BF 4	Second auxiliary fitting result of the ISUS is reported.
AUX3	AF 4..7 BF 4	Third auxiliary fitting result of the ISUS is reported.
RMS ERROR	AF 8..10 BF 4	The Root Mean Square Error of the ISUS' concentration calculation is given, in ASCII frames to 6 decimal places.
The above fields are present in all frames, the following fields only in full frames.		
T_INT	AF 5 BF 4	The temperature inside the ISUS housing is given in degrees Celsius; in ASCII frames to 2 decimal places.
T_SPEC	AF 5 BF 4	The temperature of the spectrometer is given in degrees Celsius; in ASCII frames to 2 decimal places.
T_LAMP	AF 5 BF 4	The temperature of the lamp is given in degrees Celsius; in ASCII frames to 2 decimal places.
LAMP_TIME	AI 1..6 BU 4	The lamp on-time of the current data acquisition in seconds.
HUMIDITY	AF 4..5 BF 4	The humidity inside the instrument, given in percent. Increasing values of humidity indicate a slow leak.
VOLT_12	AF 5 BF 4	The voltage of the lamp power supply.
VOLT_5	AF 5 BF 4	The voltage of the internal analog power supply.
VOLT_MAIN	AF 5 BF 4	The voltage of the main internal supply.
REF AVG	AF 7 BF 4	The average Reference Channel measurement during the sample time, in ASCII mode to 2 decimal places.
REF STD	AF 6 BF 4	The variance of the Reference Channel measurements, in ASCII mode to 2 decimal places.

SW DARK	AF 8 BF 4	An AF formatted field representing the Sea-Water Dark calculation (to 2 decimal places), in spectrometer counts.
SPEC AVG	AF 8 BF 4	An AF formatted field representing the average value of all spectrometer channels, to 2 decimal places.
CHANNEL(?1)	AI 3..5 BU 2	The counts of the first channel (wavelength ?1) of the spectrometer.
…	…	…
CHANNEL(?n)	AI 3..5 BU 2	The counts of the n-th channel (wavelength ?n) of the spectrometer.
…	…	…
CHANNEL(?256)	AI 3..5 BU 2	The counts of the last (256-th) channel (wavelength ?256) of the spectrometer.
CHECK SUM	AI 1..3 BU 1	A check sum validates frames. Satlantic's software rejects invalid frames.
TERMINATOR	AS 2 AS 2	This field marks the end of the frame by a carriage return/line feed pair (0Dhex and 0Ahex).

Depending on the frame type, the sizes of the frames (for ASCII frames including the delimiters) are:

ASCII Concentration Frame 73 bytes (maximum)
ASCII Full Frame 1694 bytes (maximum)
Binary Full Frame 605 bytes (fixed)

For a flash disk size of 256 MB, this translates to approximately 4,500,000 ASCII Concentration frames, 155,000 ASCII Full frames, or 440,000 Binary Full frames. With an acquisition rate of one frame per second, an acquisition period of 52 days (ASCII Concentration frame), 43.5 hours (ASCII Full frame) or 122 hours (Binary Full frame) can be stored on the flash disk. Larger disk sizes are available upon request.

The instrument is normally configured to periodically generate dark spectra to correct for thermal noise. This is achieved by closing an on-board shutter over the UV light source before sampling. To distinguish between *Light* and *Dark* frames, the instrument uses different frame headers. This allows any telemetry acquisition system to distinguish between sensor readings taken with the shutter opened and closed.

The different frames are distinguished by their header string: following the three letter 'SAT' identifier is a three letter frame identifier: The first letter is for ISUS frames always a 'N', indicating that the ISUS is an **N**itrate measuring instrument. The second letter indicates the shutter state of that frame ('L' for **L**ight frame, 'D' for **D**ark frame) and the third letter indicates the frame type ('C' for ASCII **C**oncentration Frame, 'F' for ASCII **F**ull Frame, and 'B' for **B**inary Full Frame).

Frame Header	**Explanation of frame header**
SATNLC	SATlantic Nitrate Light Concentration frame
SATNDC	SATlantic Nitrate Dark Concentration frame
SATNLF	SATlantic Nitrate Light Full ASCII frame
SATNDF	SATlantic Nitrate Dark Full ASCII frame
SATNLB	SATlantic Nitrate Light full Binary frame
SATNDB	SATlantic Nitrate Dark full Binary frame
