Summary

This document records the procedures followed in acquiring and “cleaning” the hydrographic data collected during the *NAME-01* oceanographic campaign in the entrance to the Gulf of California. The campaign was made from June 5 to June 18, 2004, on board of the R/V "Francisco de Ulloa". In addition to a list containing the location and date/time of the oceanographic stations and the meteorological variables measured at that time, the data from the 174 CTD profiles are summarized in the form of θ/S diagrams and plots of the variables (potential temperature, salinity, potential density anomaly, dissolved oxygen and fluorescence) vs. depth, and lists of values at standard depths. The digital data are available from the NAME website (<http://www.ofps.ucar.edu/name/>) as 1-m averages.

This information is part of the Research Project “The Role of Oceanic Processes on the Gulf of California SST Evolution during the North American Monsoon Experiment”, financed by the National Oceanic and Atmospheric Administration (NOAA), under the program PACS/GAPP, proposal GC04-219. This project was carried out thanks to the efforts of personnel from different institutions: Michael Douglas from the National Severe Storms Laboratory (NSSL), Norman, Oklahoma; Miguel Lavín and Emilio Beier from Centro de Investigación Científica y de Educación Superior de Ensenada (CICESE), Ensenada, Baja California, Mexico; Rubén Castro and Affonso Mascarenhas from Universidad Autónoma de Baja California (UABC), Ensenada, Baja California, Mexico; Peter Guest of the Naval Postgraduate School (NPS), Monterey, California; Dave Mitchell and Dorothea Ivanova of Desert Research Institute (DRI), Reno, Nevada.

Keywords: NAME, Gulf of California, Hydrographic data.

1. INTRODUCTION

Recent studies suggest that the Gulf of California is important in modulating the surrounding atmospheric circulation during the Monsoon period (between May and September). It has been observed that sea surface temperature in the Gulf of California increases significantly between May and July, when the isotherms of the continental side of the Gulf seem to ‘advance’ or move toward the interior of the Gulf. In order to establish the relative importance of the oceanic advection of heat and the local vertical heat fluxes across the sea surface in the control the evolution of the sea surface temperature during the Monsoon, the project “*The Role of Oceanic Processes on the Gulf of California SST Evolution during the North American Monsoon Experiment*” was undertaken, financed by the National Oceanic and Atmospheric Administration (NOAA), under the program PACS/GAPP, proposal GC04-219.

The project consisted of two oceanographic campaigns to the region of the entrance and southern part of the Gulf of California. The first campaign took place from June 5 to June 18 (NAME-01), and the second from August 7 to August 20 (NAME-02), both in 2004. This report deals with data from the first campaign. The data collected are meteorological and oceanographic. Two oceanographic instruments, a CTD (Conductivity-Temperature-Depth) and a LADCP (Lowering Acoustic Doppler Current Profiler), installed in the same structure, were used to perform the oceanographic part of the experiment. These two instruments were lowered down the water column, to near the bottom or to 1500 m, by means of a ship winch. The CTD used was a Sea-Bird model 911 *plus* with primary and secondary sensors for conductivity and temperature as well as sensors for pressure, oxygen and fluorescence. The LADCP (figure 1) used for measuring currents is a Workhorse Sentinel 300 kHz, from RDI-Instruments.

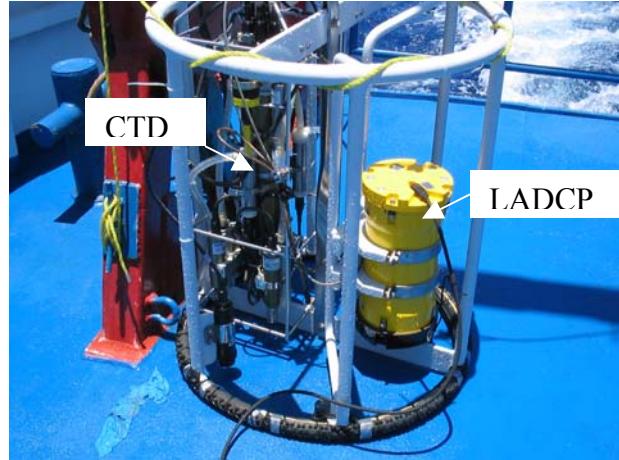

Figure 1. CTD and LADCP used for measuring in the water column.

To observe surface currents and surface temperature, several ARGOS (Fig. 2) drifting buoys were launched from the ship at various points along the course. They also measured sea surface temperature. The drifters were made by two manufacturers, by Pacific Gyre (San Diego, CA, USA) and Technocean Inc. (Miami, FL, USA). Their data will be reported separately.

Figure 2. ARGOS drifters. (a) Pacific Gyre, (b) Technocean Inc.

Meteorological variables were also sampled during the campaign. Two types of meteorological observations were made: surface and lower atmosphere measurements. The former were made by continuous measurements, at a rate of 2 Hz, of relative humidity, atmospheric pressure, magnitude and direction of the wind. The latter were performed by means of weather balloons launched from the ship (figure 3). Monitoring from the ship was through a radio probing system (fig. 4); parameters observed were potential temperature, dew point, wind velocity and direction, and atmospheric pressure at heights that reached the lower part of the stratosphere. Another type of balloons used were those followed by means of a theodolite set on the roof of the ship's bridge (Figure 5). These Balloons were followed to heights under 1 km. For details of all these meteorological observations see the report of Guest (2004), available from the NAME website (<http://www.joss.ucar.edu/cgi-bin/codiac/dss?82.105>).

Figure 3. Meteorological balloon used in the *NAME-01* campaign.

Figure 4. Vaisala radio probe system attached to the balloon for monitoring of meteorological variables in the lower atmosphere.

Figure 5. Theodolite on board the ship, to track the meteorological balloons.

Other surface data were systematically obtained by the team on the ship during the campaign. These surface data include: surface temperature, salinity (TermoSal SeaBird), fluorometry (Tuner Instruments), as well as weather (Climatronics) and current data through an RDI Vessel Mounted ADCP (153.6 kHz broad-band) on the hull of the ship.

This report describes the capture and processing of the hydrographical data: temperature, salinity, density, dissolved oxygen, and fluorescence in the water column. Meteorological data obtained at each hydrographical station are also reported. The data from the ADCP and the LADCP will be reported separately.

2. STUDY AREA

Data from the CTD casts were obtained from a grid of stations in the region of the entrance and southern part of the Gulf of California (Figure 6), between 23°N and 26°N and from 108°W to 111°W. Table I summarizes information of geographical location, date and time (UTC) of occupation, bottom depth and maximum depth of the CTD cast for each station. Casts 1 to 117 were done along lines X, Z, A, B, C, D, E, and F, shown in Figure 6. Casts 118 to 160 were repeated lines A, B and C. A set of casts (161-174) made at the entrance of Bahía de La Paz, Baja California Sur, between the Espíritu Santo and San José Islands are also shown in Figure 7.

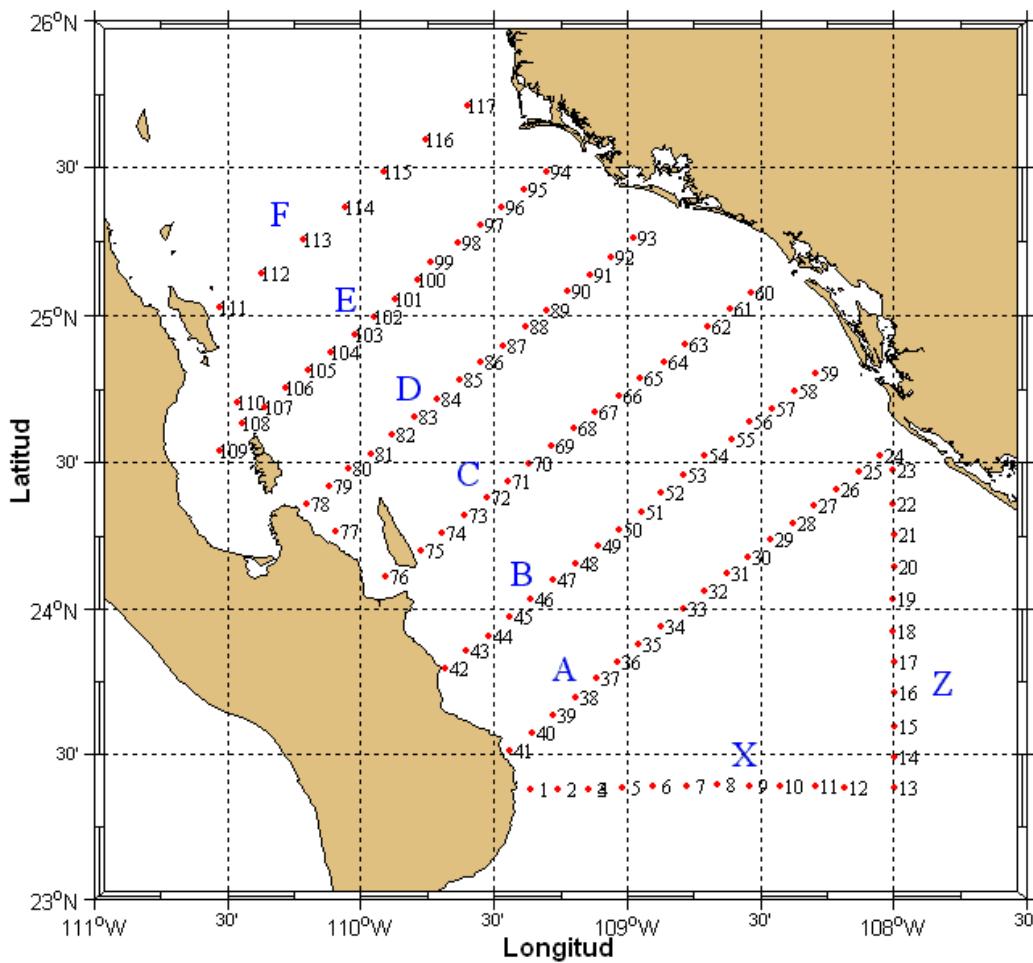

Figure 6. Location of the studied area and geographical position of the station grid. Sequential number of casts is shown. The axes of the figure may not be to the same scale, in order to improve visualization of cast number.

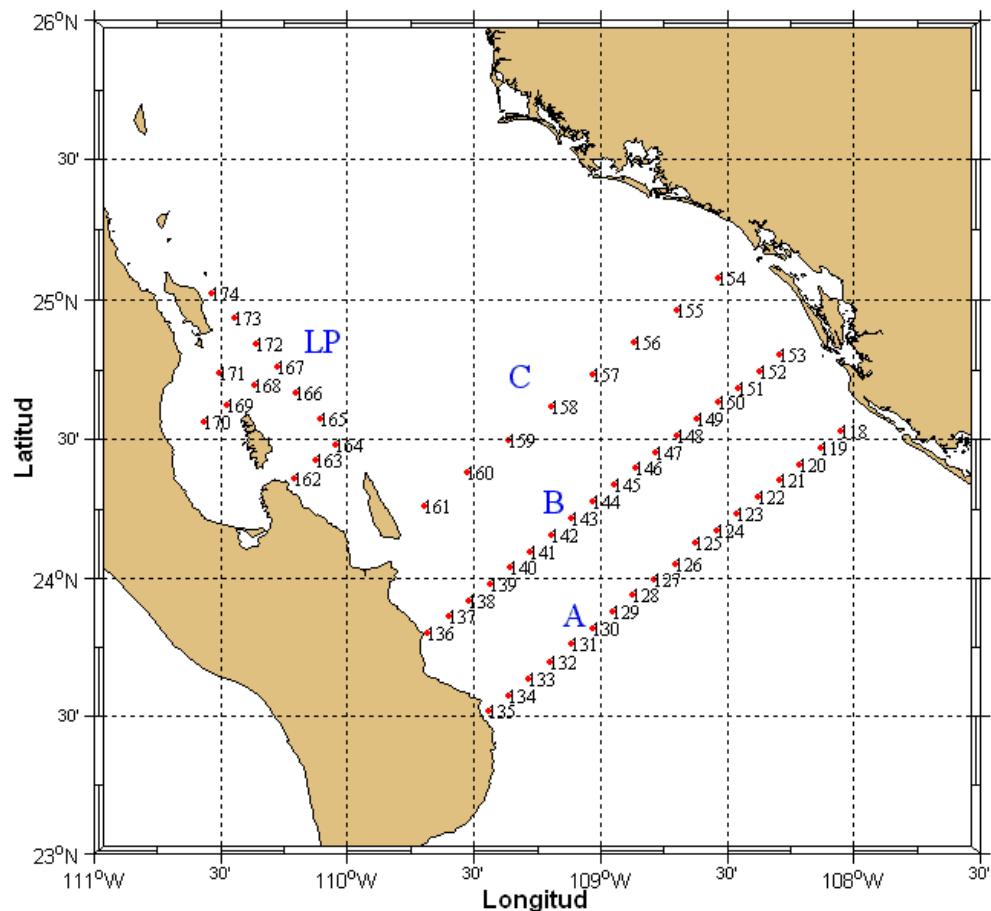

Figure 7. Geographical location of the repeated grid of stations. Sequential number of the cast is shown. The axes of the figure may not be to the same scale, in order to improve visualization of cast number.

Table I. General information of the CTD stations made during the *NAME-01* campaign.

3. INSTRUMENTATION

3.1 CTD calibration.

The CTD SBE-911 *plus*, manufactured by Sea-Bird Electronics Inc., consists of an underwater unit and a deck unit. The former carries out the measurements of pressure, temperature and conductivity sensors (primary and secondary) as well as four auxiliary channels that can allow attachment of other sensors, such as turbidity or dissolved oxygen. The underwater unit synchronizes the acquisition of data and sends them to the deck unit in the laboratory, through the conducting CTD cable. The deck unit stores the data and allows monitoring of the cast. Factory specifications for the CTD are shown in table II.

TABLE II. CTD *SBE-911 plus* Sensor specifications as provided by the manufacturer.

PARAMETER	RANGE	PRECISION	RESOLUTION	STABILITY
Conductivity [Siemens/m]	0-7	0.0003	0.00004	0.0003 S/m/month
Temperature [°C]	-5 a 35	0.001	0.0003	0.0002 °C/month
Pressure [psi]	0-15000	0.015% of full scale	0.001 % of full scale	0.0015 % of full scale
Dissolved oxygen [ml/l]	0-15	0.1	0.01	---
Fluorescence [µg/l]	0-150	0.02	0.03	---

CTD sensors were calibrated at the Sea-Bird Electronics Inc. laboratories in January and March of 2004. Table III shows the results of submerging the temperature sensors in a bath with temperature changes. The pressure sensor (digiquartz 410K-105)

was calibrated in March, 2004. The calibration was performed via a standard piston of the Ruska type, model 5201 with an error of < 1.5 psi in a maximum pressure of 10000 psi. The outset frequencies of the temperature and conductivity sensors are used to tabulate the calibration coefficients for conversion equations to units of the International Unit System in Oceanography (UNESCO, 1985).

TABLE III. Calibration experiments for temperature sensors. March, 2004.

Serial Number 2704			Serial Number 2725		
Standard Temperature [°C]	CTD [°C]	Residual [°C]	Standard Temperature [°C]	CTD [°C]	Residual [°C]
-1.50004	-1.50010	-0.00006	-1.50000	-1.50004	-0.00004
1.00007	1.00010	0.00007	1.00003	1.00010	0.00007
4.50004	4.50010	0.00006	4.50000	4.50001	0.00001
8.00003	8.00000	-0.00003	8.00000	7.99995	-0.00005
11.50000	11.49993	-0.00007	11.50004	11.50000	-0.00004
15.0000	14.99994	-0.00006	15.00000	15.00002	0.00002
18.50003	18.50010	0.00007	18.50000	18.50004	0.00004
22.00000	22.00015	0.00005	22.00000	22.00002	0.00002
25.50000	25.50000	0.00000	25.50003	25.50000	-0.00003
29.00004	29.00000	-0.00004	29.00003	29.00000	-0.00003
32.50000	32.50001	0.00001	32.50000	32.50002	0.00002

CTD conductivity sensors were also calibrated in laboratory against standards. The comparison was made by means of 2 experiments, varying temperature and varying salinity. The results are shown in Table IV. Finally, the results of the laboratory calibration of the dissolved oxygen sensor are presented in Table V.

The measurements of *in vivo* fluorescence performed with the sensor installed in the CTD allow accurate calculations of the vertical distribution of the phytoplankton biomass, measured as chlorophyll concentration. These measurements should be accompanied by control samples of chlorophyll concentration to make corrections to the standard fluorimetric method proposed by Holm-Hansen *et al.* (1965). The reasons for doing this are mainly that chlorophyll is contained in packages inside the phytoplankton, causing an effect of self-shading that produces low results. There are other substances that emit fluorescence in the sea, such as the CDOM (Colored Dissolved Organic Matter), detritus (particulate matter) that affect chlorophyll concentration calculations by the sensor.

TABLE IV. Results from conductivity calibration in the laboratory. March, 2004.

Standard Temperature [°C]	Standard Salinity [UPS]	Serial Number 2260			Serial Number 2253

3.2 CTD data retrieval

Data from the CTD, in frequency units and with a sampling rate of 24 Hz, were converted to digital data via the SSEA-11 *plus* recording unit. This recording unit sends the digitalized data to a personal computer where they are stored in the hard disk while displaying them in graphic form. The only processing in real time is the sub sampling of raw data that are displayed on the screen of the computer to monitor the cast.

4. CTD DATA PROCESSING AND PRESENTATION

The goal of processing CTD data is to produce, with the utilities provided by the manufacturer, profiles that are clean of all types of errors (noise and "spikes"). The utilities used here are those provided by the Sea-Bird (2004) manufacturer. As a first step, data with differences greater than two standard deviations among 48 successive data (2 seconds) of

pressure, temperature and conductivity are identified and eliminated. The WILDEDIT module carries this out. Later, it is necessary to correct time lag between the signals of the temperature and conductivity sensors. A delay of 0.073 caused by the position of the sensors in the water pumping duct, which is always constant, is used. This correction is done via the ALIGNCTD module. If this is not corrected, leaps or “spikes” will appear when calculating salinity in areas with a strong thermal gradient. Subsequently, reduction of high-frequency noise is necessary. For pressure and conductivity this noise is reduced via repeated low-pass filtering with a time constant of 0.20 s and 0.045 s, for the respective sensors. The FILTER module is in charge of performing this task. Afterward, it is necessary to make an adjustment because of the water flow through the pumping duct, which produces thermal anomalies in the conductivity cell, especially when the CTD passes through strong temperature gradients. The module used to correct this anomaly is called CELLM, and two parameters are required ($\alpha=0.034$ y $\tau=7.0$ s) to minimize the differences of salinity between the lowering profile and the ascending profile. The values recommended by the manufacturer were used (Godínez *et al.*, 2003). As a last correction, the LOOPEDIT module is applied to correct the error produced by the irregular movement of the ship when lowering or rising the CTD.

After applying those modules on the data retrieved from the pair of secondary and primary CTD sensors, a clean profile is obtained. This profile can be averaged and used to calculate the different oceanographic variables of interest (UNESCO, 1988). The final data from this campaign were averaged to 1 db, and are downloadable from the NAME website. The algorithms developed by Fofonoff and Millard (1983) were used to calculate salinity. In accordance with the recommendation of UNESCO (1991), the anomaly of potential density is reported ($\gamma_0 \text{ kgm}^{-3}$).

Appendix A shows data of the CTD primary sensors in the shape of vertical profiles of potential temperature (θ), salinity and density anomaly (γ_0), along with a discrete listing of data at selected depths and meteorological variables obtained at the station. The symbols of the headlines are given in Table VI. A not-measured variable is reported with a value of 99.9 and, for the case of cloudiness, with 9.

Table VI. Symbols used as headers of vertical CTD profiles.

STATION	Name of station
CAST	Cast Number
LATITUDE	Geographical Location ($^{\circ}$ N)
LONGITUDE	Geographical Location ($^{\circ}$ W)
DD/MM/AA	Date day/month/year
H	Universal Time (UT)
PROFTOT	Depth of Bottom (m)
TEMSUP	Surface Temperature [$^{\circ}$ C]
SALSUP	Surface Salinity [ups]
TEBUHU	Wet Bulb Temperature [$^{\circ}$ C]
TEBUSE	Dry bulb temperature [$^{\circ}$ C]
V-MAG	Wind Speed[m/s]
DIR	Wind direction [azimuth]
NUBES	Cloudiness [octas]
BAROM	Atmospheric pressure [mb]
PR	CTD Pressure [db]
θ	CTD Potential Temperature [$^{\circ}$ C]
SA	CTD Salinity [psu]
γ_{θ}	Density -1000 [kg/m^3]
O ₂	Dissolved Oxygen [ml/l]
FLU	Fluorescence [$\mu\text{g}/\text{l}$]

Figure 8 presents a diagram of all the CTD casts, as a test of the quality of the data. The presence of lobes or salinity inversions in the θ -S diagram is evident (temperatures between 13 and 20 $^{\circ}$ C). These types of structures have been documented previously for this zone by Godínez et al., (2005).

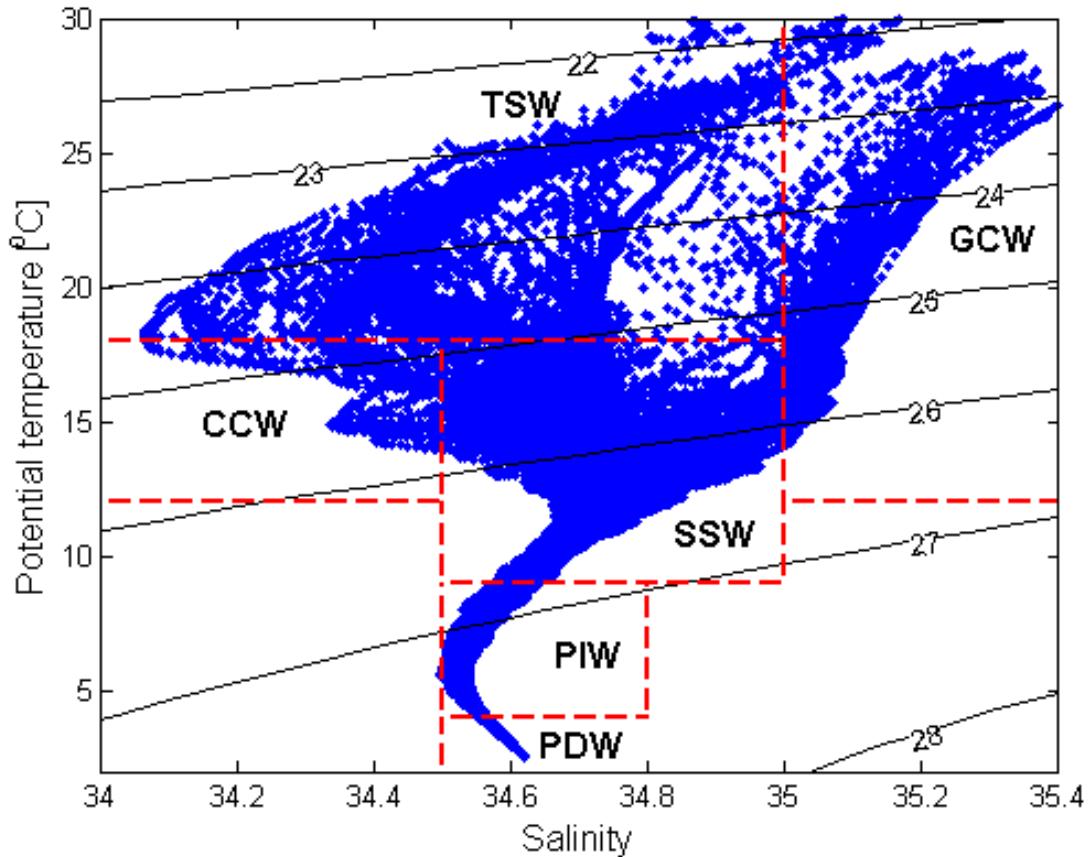

Figure 8. θ -S diagram of all CTD stations in the *NAME-01* campaign. The thermohaline ranges (red lines) proposed by Torres-Orozco (1993) are included: GCW = Gulf of California Water; TSW= Tropical Surface Water; CCW= California Current Water; SSW= Subtropical Subsurface Water; PIW= Pacific Intermediate Water; PDW= Pacific Deep Water. The density anomaly contours are included.

5 ACKNOWLEDGEMENTS

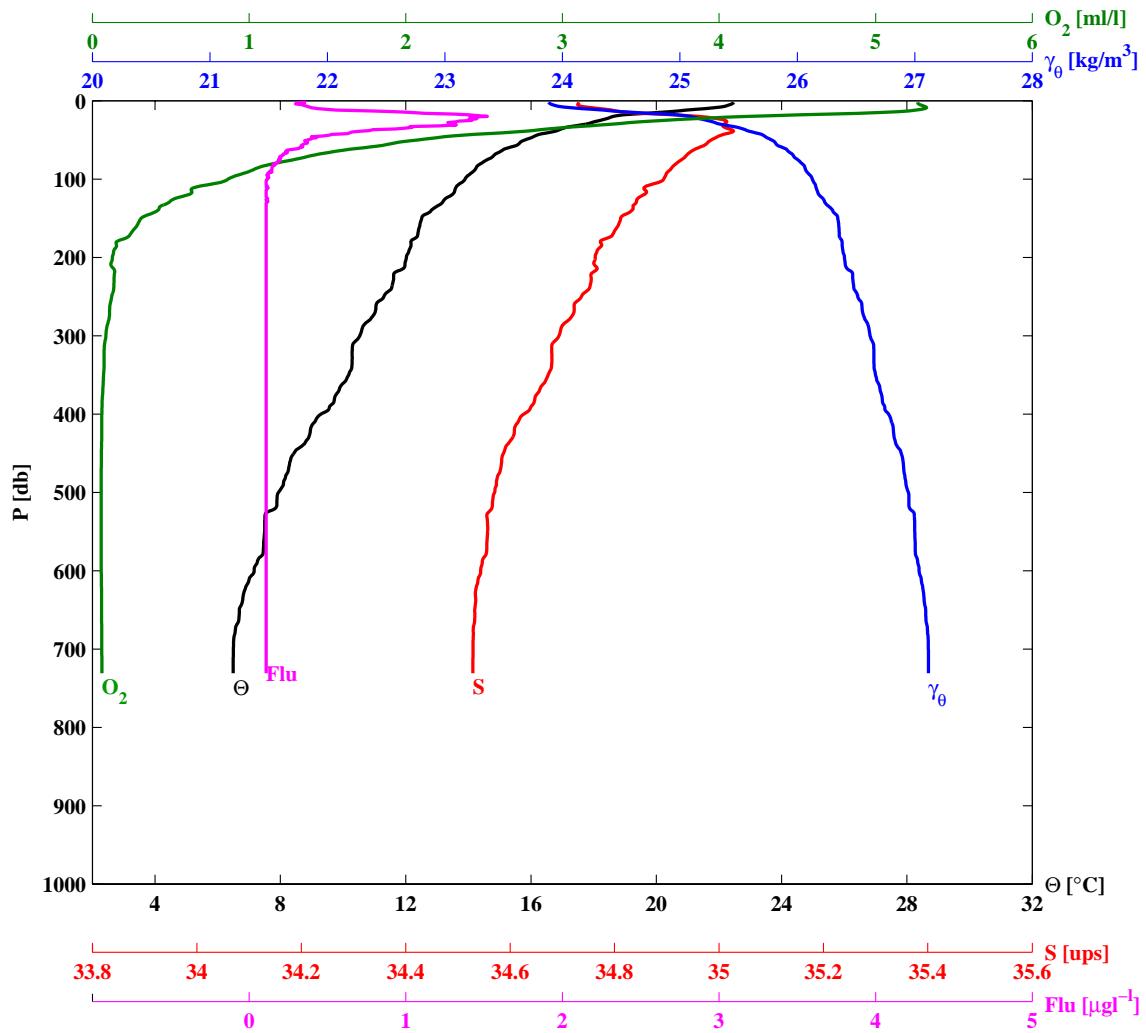

This work is a product of the project “**The Role of Oceanic Processes on the Gulf of California SST Evolution during the North American Monsoon Experiment**” financed by the National Oceanic and Atmospheric Administration (NOAA), under the program PACS/GAPP, proposal GC04-219. Additional support was provided by the Physical Oceanography Department of CICESE. We thanks: Mr. Carlos F. Flores Cabrera, and Mr. Rodolfo Camacho Torres for their technical help during the campaign. Cap. M.M.N. Moisés Mendoza Hernández, captain of the B/O Francisco de Ulloa, and his crew contributed greatly to the success of this campaign. Our thanks to Dr. Affonso Mascarenhasof UABC for his support with personnel transportation. Thanks also to Julieta Castro Sandoval and Guadalupe Pacheco Cabrera for their invaluable administrative support.
