Appendix B: Classification of precipitation types

After determining the volume equivalent diameter (D) and the particle speed (V) Parsivel subdivides the particles into appropriate classes. The scale of this classification is smaller for small, slow particles than for large and fast particles.

B.1 Class limits

The measured particles are subdivided into D and V classes in a two-dimensional field, wherein there are 32 different D and V classes so that there are a total of $32 \times 32 = 1024$ classes.

Classification according to volume-equivalent diameter
